Virtual Cities - Konstantinos Dimopoulos 2020-11-12

Virtual cities are places of often-fractured geographies, impossible physics, outrageous assumptions and almost untamed imaginations given digital structure. This book, the first atlas of its kind, aims to explore, map, study and celebrate them. To imagine what they would be like in reality. To paint a lasting picture of their domes, arches and walls. From metropolitan sci-fi open worlds and medieval fantasy towns to contemporary cities and glimpses of gothic horror, author and urban planner Konstantinos Dimopoulos and

visual artist Maria Kallikaki have brought to life over forty game cities. Together, they document the deep and exhilarating history of iconic gaming landscapes through richly illustrated commentary and analysis. *Virtual Cities* transports us into these imaginary worlds, through cities that span over four decades of digital history across literary and gaming genres. Travel to fantasy cities like World of Warcraft's Orgrimmar and Grim Fandango's Rubacava; envision what could be in the familiar cities of Assassin's Creed's London and Gabriel Knight's New Orleans; and steal a glimpse of cities of the future, in Final Fantasy VII's Midgar and Half-Life 2's City 17. Within, there are many more worlds to discover – each formed in the deepest corners of the imagination, their immense beauty and complexity astounding for artists, game designers, world builders and, above all, anyone who plays and cares about video games.

Urban Informatics - Wenzhong Shi 2021-04-06

This open access book is the first to systematically introduce the principles of urban informatics and its application to every aspect of the city that involves its functioning, control, management, and future planning. It introduces new models and tools being developed to understand and implement these technologies that enable cities to function more efficiently - to become 'smart' and 'sustainable'. The smart city has quickly emerged as computers have become ever smaller to the point where they can be embedded into the very fabric of the city, as well as being central to new ways in which the population can communicate and act. When cities are wired in this way, they have the potential to become sentient and responsive, generating massive streams of 'big' data in real time as well as providing immense opportunities for extracting new forms of urban data through crowdsourcing. This book offers a comprehensive review of the methods that form the core of urban informatics from various kinds of urban remote sensing to new approaches to machine learning and statistical modelling. It provides a detailed technical introduction to the wide array of tools information scientists need to develop the key urban analytics that are fundamental to learning about the smart city, and it outlines ways in which these tools can be used to inform design and policy so that cities can become more efficient with a greater concern for environment and equity.

Virtual Crowds - Nuria Pelechano 2008

There are many applications of computer animation and simulation where it is necessary to model virtual crowds of autonomous agents. Some of these applications include site planning, education, entertainment, training, and human factors analysis for building evacuation. Other applications include simulations of scenarios where masses of people gather, flow, and disperse, such as transportation centers, sporting events, and concerts. Most crowd simulations include only basic locomotive behaviors possibly coupled with a few stochastic actions. Our goal in this survey is to establish a baseline of techniques and requirements for simulating large-scale virtual human populations. Sometimes, these populations might be mutually engaged in a common activity such as evacuation from a building or area; other times they may be going about their individual and personal agenda of work, play, leisure, travel, or spectator. Computational methods to model one set of requirements may not mesh well with good approaches to another. By including both crowd and individual goals and constraints into a comprehensive computational model, we expect to simulate the visual texture and contextual behaviors of groups of seemingly sentient beings. Table of Contents: Introduction / Crowd Simulation Methodology Survey / Individual Differences in Crowds / Framework (HiDAC + MACES + CAROSA) / HiDAC: Local Motion / MACES: Wayfinding with Communication and Roles / CAROSA: Functional Crowds / Initializing a Scenario / Evaluating Crowds
